Humanity has never stopped envisioning the future

The Nobel price in physics 2024

PRESS RELEASE

8 October 2024

The Nobel Prize in Physics 2024

The Royal Swedish Academy of Sciences has decided to award the Nobel Prize in Physics 2024 to

John J. Hopfield
Princeton University, NJ, USA

Geoffrey E. Hinton
University of Toronto, Canada

"for foundational discoveries and inventions that enable machine learning with artificial neural networks"

They trained artificial neural networks using physics

This year's two Nobel Laureates in Physics have used tools from physics to develop methods that are the foundation of today's powerful machine learning. John Hopfield created an associative memory that can store and reconstruct images and other types of patterns in data. Geoffrey Hinton invented a method that can autonomously find properties in data, and so perform tasks such as identifying specific elements in pictures.

When we talk about artificial intelligence, we often mean machine learning using artificial neural networks. This technology was originally inspired by the structure of the brain. In an artificial neural network, the brain's neurons are represented by nodes that have different values. These nodes influence each other through connections that can be likened to synapses and which can be made stronger or weaker. The network is *trained*, for example by developing stronger connections between nodes with simultaneously high values. This year's laureates have conducted important work with artificial neural networks from the 1980s onward.

John Hopfield invented a network that uses a method for saving and recreating patterns. We can imagine the nodes as pixels. The *Hopfield network* utilises physics that describes a material's characteristics due to its atomic spin – a property that makes each atom a tiny magnet. The network as a whole is described in a manner equivalent to the energy in the spin system found in physics, and is trained by finding values for the connections between the nodes so that the saved

images have low energy. When the Hopfield network is fed a distorted or incomplete image, it methodically works through the nodes and updates their values so the network's energy falls. The network thus works stepwise to find the saved image that is most like the imperfect one it was fed with.

Geoffrey Hinton used the Hopfield network as the foundation for a new network that uses a different method: the *Boltzmann machine*. This can learn to recognise characteristic elements in a given type of data. Hinton used tools from statistical physics, the science of systems built from many similar components. The machine is trained by feeding it examples that are very likely to arise when the machine is run. The Boltzmann machine can be used to classify images or create new examples of the type of pattern on which it was trained. Hinton has built upon this work, helping initiate the current explosive development of machine learning.

"The laureates' work has already been of the greatest benefit. In physics we use artificial neural networks in a vast range of areas, such as developing new materials with specific properties," says Ellen Moons, Chair of the Nobel Committee for Physics.

John J. Hopfield, born 1933 in Chicago, IL, USA. PhD 1958 from Cornell University, Ithaca, NY, USA. Professor at Princeton University, NJ, USA.

Geoffrey E. Hinton, born 1947 in London, UK. PhD 1978 from The University of Edinburgh, UK. Professor at University of Toronto, Canada.

Prize amount: 11 million Swedish kronor, to be shared equally between the laureates.

The Royal Swedish Academy of Sciences, founded in 1739, is an independent organisation whose overall objective is to promote the sciences and strengthen their influence in society. The Academy takes special responsibility for the natural sciences and mathematics, but endeavours to promote the exchange of ideas between various disciplines.

Is AI a myth in the Enterprise or is it real

The world you desire can
be won, it exists, it is real,
it is possible, it is yours.

Ayn Rand

quote fancy

What do we expect of AI in Enterprise Networking?

Enhanced Security

Network Optimization

Automated Network Management

Data Analytics and Insights

Scalability

Cost Efficiency

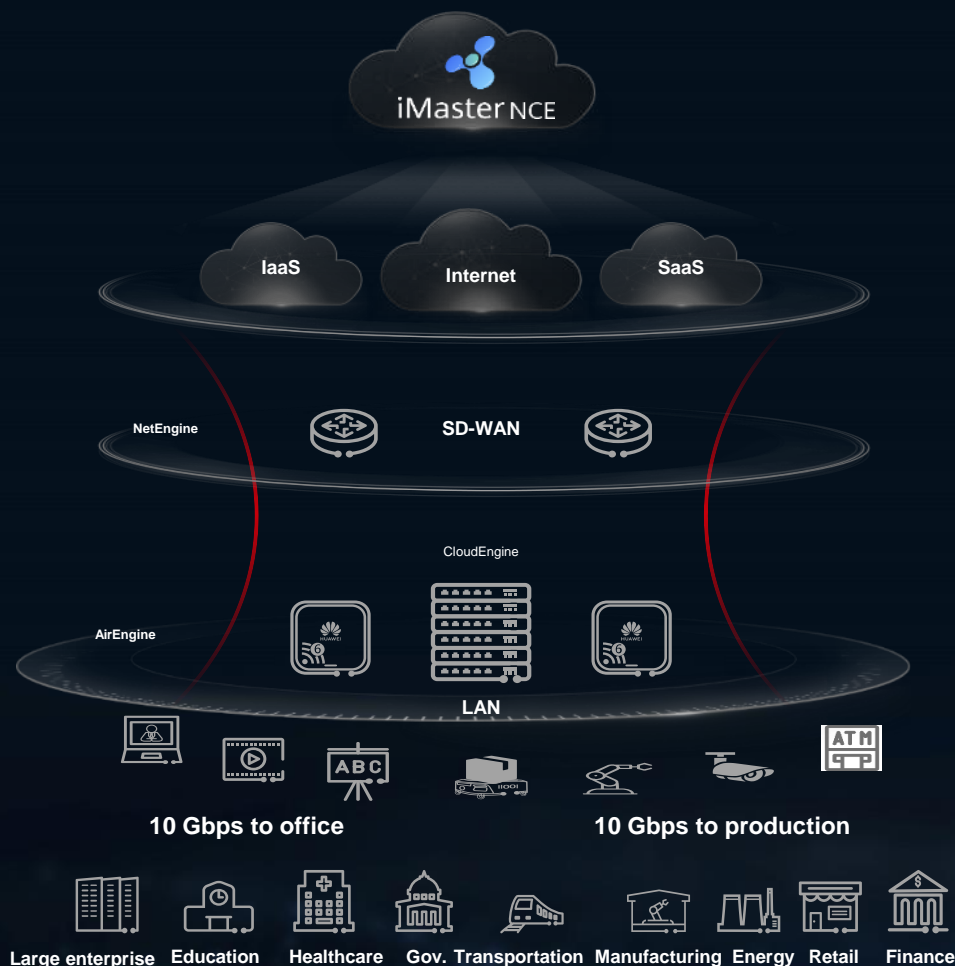

User Experience Improvement

Compliance and Governance

Build high-quality 10 Gbps campus with CloudCampus

Simplified O&M

Digital map
Unified service orchestration, automatic network deployment, AI-powered O&M, fault locating in minutes

10x
O&M efficiency

Ultimate experience

Audio & video and VIP experience assurance
One device (S8700) for experience assurance for 10,000 users; 4-level experience assurance: application, user, terminal, and network

0
video conference interruption

Simplified architecture

All in one, one for all
One network for OA, production, security, and IoT services
2000 m PoE, pay-as-you-grow

50% ↓
TCO

Ultra-high-speed access

10 Gbps to room, 10 Gbps to AP
Wi-Fi 7: 120-channel smooth HD video
Multi-GE access, high-density 100GE core

5x ↑
Terminal speed

Digital Map: visibility, automation and intelligent O&M

Trends & challenges

One-screen Monitoring

Too many management systems switching

Fast Provisioning

Scattered branches, Massive devices

Fast Troubleshooting

Frequent network incidents, inefficient service assurance and fault locating

Solution & benefits

One-map visibility

OPEX costs

80% ↓

One-click provisioning

Provisioning time

20x ↓

One-second fault location

O&M efficiency

10x ↑

Four-dimensional visibility: Network status, Terminal visibility, User experience visibility, Application experience visibility.

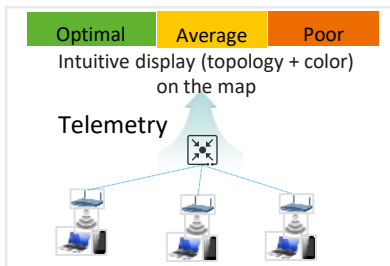

[video] Huawei Digital Map

User experience assurance (VIP Users)

Real-time awareness of user experience

- Telemetry-based network data collection in seconds
- Precise modeling of VIP user experience

Second-level fault detection

vs. traditional minute-level polling

90% ↓

locating time

In minutes vs. In hours

90% ↑

assurance efficiency
poor-QoE alarms for VIP users

One-Stop VIP experience assurance

- One-Stop setting for VIP, allowing preferential access and bandwidth reservation

Campus network digital map locating faults in seconds and 0 user complaints

Application experience assurance

Application experience awareness

- AI-powered identification of 1000+ mainstream applications

1000+
applications identified
1000+ vs. Industry 300+

Visualized full-path

- Unique iPCA-based IFIT.
Visualized application quality

95%↓
troubleshooting time
iPCA (Huawei exclusive)

One-Stop application assurance

- Automatic generation of assurance policies

90%↑
conference assurance
efficiency
30+ steps → One-Stop

Campus network digital map ensuring always-smooth video conferences

O&M upgrade to build a Green Campus experience

4d Energy Visualization

- Multiple dimensions: Overview, site, floor, and device

100%
Energy Visualization
4D VS only AP

Dynamic Energy-Saving

- AI group tidal algorithm, identifying off-peak hours for energy saving

30%↓
Energy Saving
30% VS industry 10%

Key service assurance

- Feature walk algorithm, reserved AP, and no disconnection of dumb terminals

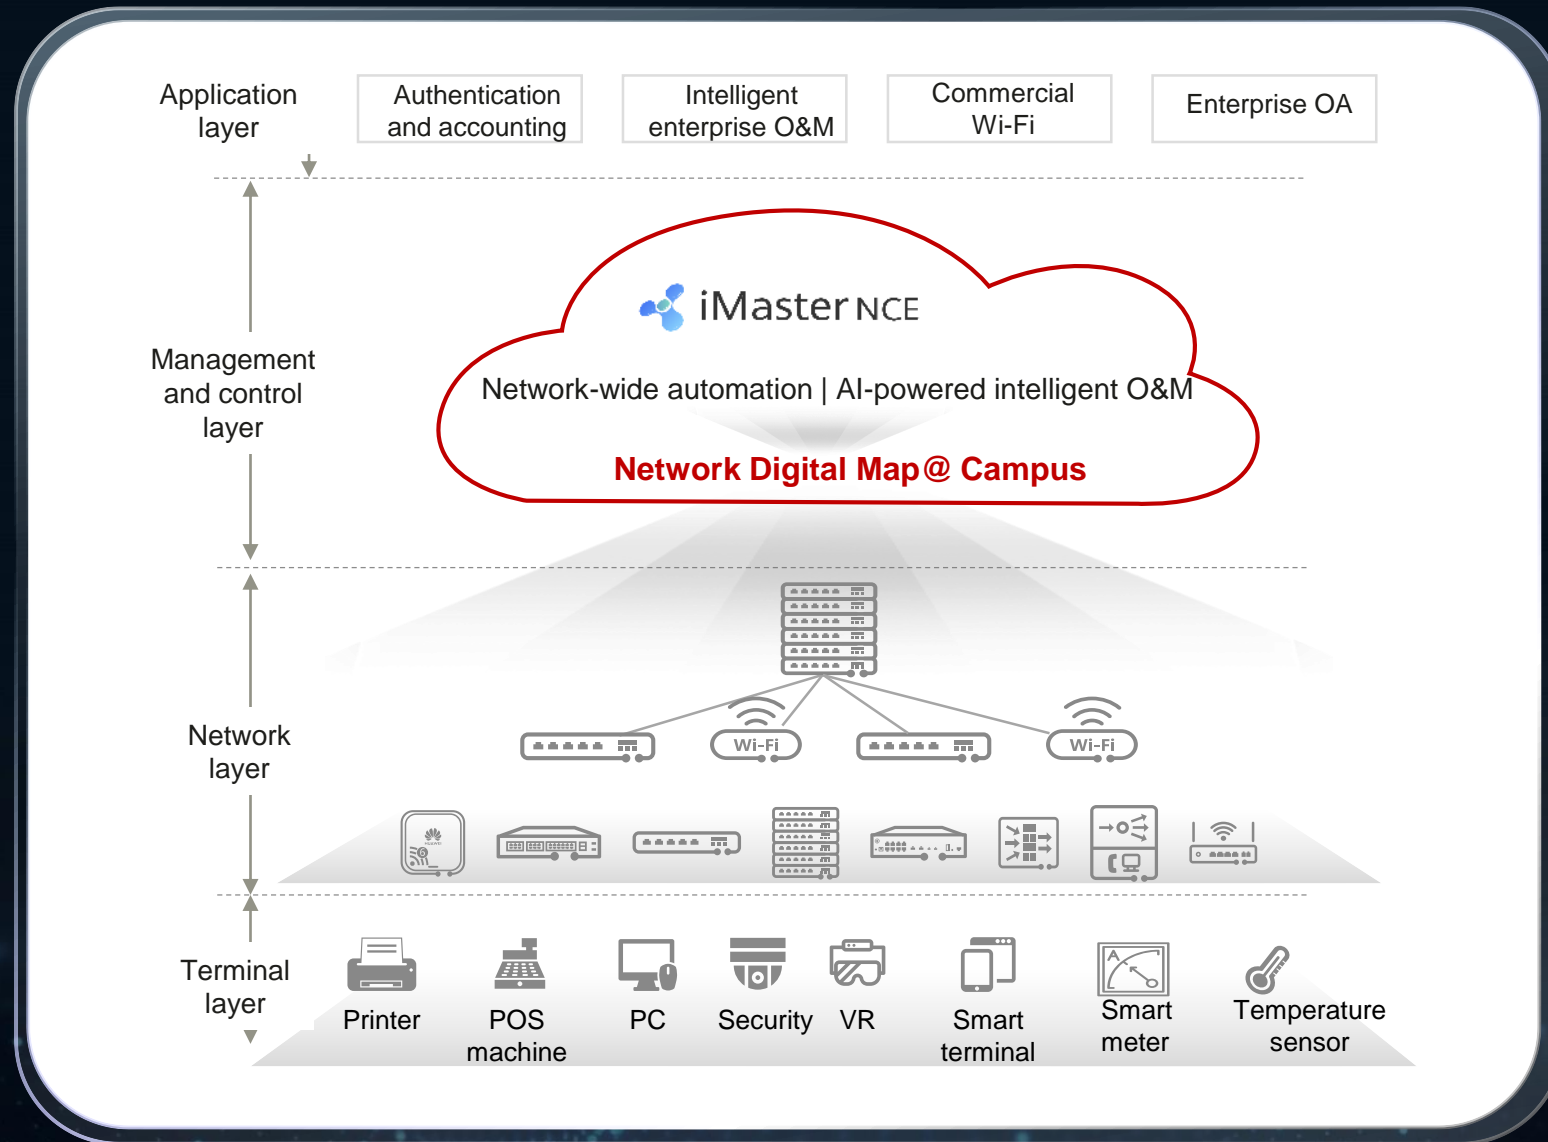

0
Key service interruption
reserved AP VS not support

Campus network digital map

30% energy saving
